Screw Compressor Vibration Analysis
Vibration analysis determined the problem existed 18 months before the major overhaul was required. There was no back up compressor to run through a heavy production time.

Vibration Case Study - Screw Compressor Problems
Flow-induced vibration, or vortex shedding, is due to high flow velocities such as in a piping dead leg of a centrifugal compressor system. This study evaluates vortex shedding and potential vibration across dead leg branches.

Dear Ghasem.Bashiri First, the size required for lines attached to compressor is determine by the
gas velocity inside the lines, the gas velocity inside the lines must be limited to remain within
acceptable vibration ranges. and in case of low suction pressure, the pressure drop may sometimes
be a limitation, in this case, the pressure drop ...
